

LAB#12

Example#1: Write a program to insert data in a binary search tree.

Solution:

```
1 class Node:
2     def __init__(self, left=None, item=None, right=None):
3         self.left=left
4         self.item=item
5         self.right=right
6
```

```
7 class BST:
8     def __init__(self):
9         self.root=None
10    def insert(self, data):
11        self.root=self.rinsert(self.root, data)
12    def rinsert(self, root, data):
13        if root is None:
14            return Node(None, data, None)
15        if data < root.item:
16            root.left=self.rinsert(root.left, data)
17        elif data > root.item:
18            root.right=self.rinsert(root.right, data)
19        return root
```

```
t1=BST()
t1.insert(80)
t1.insert(100)
t1.insert(70)
t1.insert(90)
t1.insert(60)
```

Explanation:

```
t1=BST()
```

```
t1=BST()
```

```
def __init__(self):  
    self.root=None
```

```
t1.insert(80)
```

```
t1.insert(80)
```

```
def insert(self,data):  
    self.root=self.rinsert(self.root,data)
```

```
def rinsert(self,root,data):  
    if root is None:  
        return Node(None,data,None)
```

8000

self.root=8000

```
t1.insert(100)
```

```
def insert(self,data):  
    self.root=self.rinsert(self.root,data)
```

```
self.root= self.rinsert(8000,100)
```

```
def rinsert(self,root,data):
```

```
    elif data>root.item:  
        root.right=self.rinsert(root.right,data)  
    return root
```

root.right=None

```
return root(8000)
```

```
def rinsert(self,root,data):  
    if root is None:  
        return Node(None,data,None)
```

1000

return 1000

root.right=1000

Updated table:

root.right=1000

self.root=8000

```
t1.insert(70)
```

```
def insert(self,data):  
    self.root=self.rinsert(self.root,data)
```

```
def rinsert(self,root,data):  
    data is 70 root is 8000  
  
    if data<root.item:  
        root.left=self.rinsert(root.left,data)  
  
    return root
```

root.left is None here

return 8000

```
def rinsert(self,root,data):  
    if root is None:  
        return Node(None,data,None)
```

7000

return 7000

self.left=7000

t1.insert(90)

```
def insert(self,data):  
    self.root=self.rinsert(self.root,data)
```

```
def rinsert(self,root,data):
```

```
    elif data>root.item:
```

```
        root.right=self.rinsert(root.right,data)
```

```
    return root
```

root 8000
data is 90

return 8000

```
def rinsert(self,root,data):
```

```
    if data<root.item:
```

```
        root.left=self.rinsert(root.left,data)
```

```
    return root
```

root 1000
data 90

return 1000

```
def rinsert(self,root,data):
```

```
    if root is None:
```

```
        return Node(None,data,None)
```

root is None
data is 90

90

return 9000

Activate Windows

Go to Settings to activate Windows.

```
t1.insert(60)
```

```
def insert(self,data):  
    self.root=self.rinsert(self.root,data)
```

```
def rinsert(self,root,data):  
    if data<root.item:  
        root.left=self.rinsert(root.left,data)
```

```
    return root
```

return 8000

```
def rinsert(self,root,data):
```

```
    if data<root.item:  
        root.left=self.rinsert(root.left,data)  
  
    return root
```

return 700

```
def rinsert(self,root,data):
```

```
    if root is None:  
        return Node(None,data,None)
```

root is None
data is 60

6000

return 6000

Activate Windows
Go to Settings to activate Windows

Class Assignment

Q: Modify the program LAB#12 example#1 by creating two trees in this same program. Insert four number of items in the first tree and five number of items in the second tree. Explain the code diagrammatically.

Note:

Implement two binary search trees one by one.

Similar elements are not allowed in a binary search tree.
